Unique Phosphorylation Antibody

Protein modification refers to the post-translational modification of chemical groups in proteins to change their physical and chemical properties, which in turn affects their spatial conformation, activity, stability and interaction with other molecules, and thus participates in the regulation of a variety of life processes in the organism. At present, more than 20 kinds of protein modifications have been found, the common protein modifications are: ethylcooling, ubiquitination, methylation, phosphorylation, etc.; there are also some special modifications, such as croton sparing, in two cool, propylcooling, succinylcooling, glycosylation, etc., which also play an important role in the life activities.

Among them, protein phosphorylation modification is one of the most common and important post-translational modifications of proteins, and it is estimated that nearly 1/3 of proteins in eukaryotes are modified by phosphorylation, which plays a crucial role in regulating signal transduction, gene expression, cell cycle, developmental differentiation and many other processes.

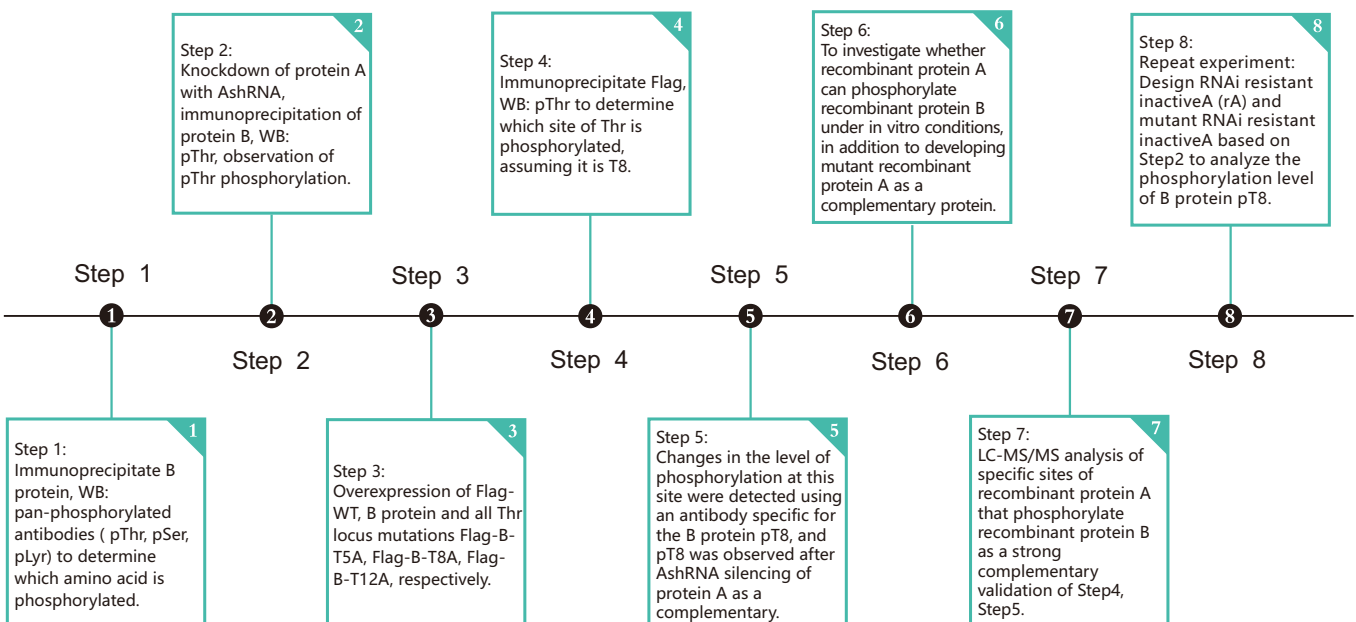

Protein phosphorylation modification is the process of transferring phosphate groups from ATP molecules to specific sites (Ser, Thr, yr residues, etc.) in protein molecules by protein phosphokinase. It has been shown that protein interactions can be regulated by multisite phosphorylation modifications. Abnormal up-regulation or down-regulation of protein phosphorylation levels is closely related to the development of various diseases such as cancer, diabetes, metabolic syndrome, Alzheimer's disease, etc.

Affinity Bioscience's antibody has launched more than 2400 unique phosphorylated antibodies, including more than 800 unique phosphorylated antibodies that are prepared for specific phosphorylation sites, i.e. site-specific, which is more specific than pan-phosphorylated antibodies, and are able to more clearly explore the effects of phosphorylation at a single or multiple sites on the function of proteins, opening up new perspectives in research. A New Perspective on Research.

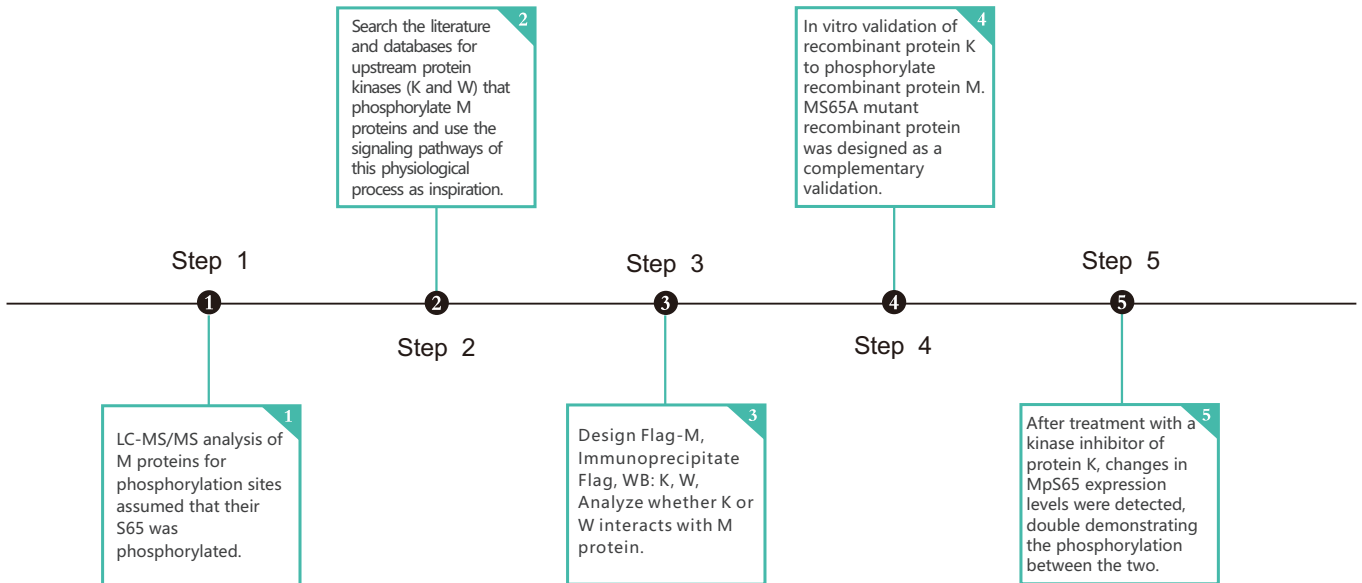

Experimental Design Protocol for Phosphorylation

Site Screening It is known that the downstream target of protein A is protein B. Find the phosphorylation site of protein B.

Find the protein upstream of the M protein that interacts with it, and find the phosphorylation site of the M protein.

Phospho-EGFR (Ser1070) Antibody - #AF3044

AF3044 at 1/200 staining human lymph node tissue sections by IHC-P.

IHC pElisa Cites 1/5

Clicking on PTM brings up two drop-down boxes, as shown on the left.

The first row (P00533 as Substrate) lists all post-translational modification sites and upstream kinases of this protein.

The second row (P00533 as PTM Enzyme) lists the downstream target proteins of the protein when it acts as a kinase.

Product Info	Immunogens	As Substrate	Background	Product Info	Immunogens	As Enzyme	Background
Y585	Phosphorylation			U/5088-1 (5-AMK)	Y152		Uniprot

Column 1 Site: Post-translational modification site
 Column 2 PTM Type: Type of post-translational modification
 Column 3 Enzyme: Upstream kinase
 Column 4 Source: Database source

Column 1 Substrate: Substrate
 Column 2 Site: Catalytic site of the kinase
 Column 3 Source: Database source

Tips:

① Whether you are looking for an upstream enzyme or a downstream substrate, click on the protein ID on the left to go directly to the Uniprot protein database, and click on the protein name in parentheses to search for the corresponding Affinity antibody.

② If the site is highlighted in orange, it means that Affinity has the spot-phosphorylated antibody for the corresponding site, click on the site to go directly to the antibody page.

BRAND INTRODUCTION

Affinity Biosciences' R&D Centre has a modern comprehensive laboratory, aseptic operation room, SPF animal room, equipped with advanced flow cytometry, laser confocal, digital scanning of pathological sections and other experimental instruments. So far, we have developed more than 15,000 kinds of antibodies and 16,000 kinds of peptides. Among them, phosphorylated antibodies are the strongest products of Affinity brand, which adopts peptide antigen + affinity purification, which conforms to the internationally recognised definition of Monospecific antibody, and adopts independent antibody validation, one of the 5 major validation strategies proposed by IWGAV, combined with Affinity's characteristic The combination of blocking peptide + MS validation realises multiple validations of antibody quality and ensures that the specificity and sensitivity of each antibody is optimised. Since 2018, Affinity has been awarded the 2019 and 2020 Award by CitAb and has become the first company to ever in the world to receive this award in consecutive years.

• Advantages

1: High quality and diverse antigens.

- Screening of designed polyskin sequences using Affinity's proprietary antigenic epitope prediction software.
- Proprietary multi-drug chemistry for optimized antigen presentation.
- High-throughput polysaccharide synthesis technology.

2: Specialized antibody screening and purification technologies.

- Production of antibodies with specific modifications such as phosphorylation, methylation, ethyl cooling, etc.
- High-throughput antibody screening technology.
- Selection of low background, high affinity antibody purification programs.

3: Superior Antibody Validation Strategy

- Use of closed belly + MS antibody validation strategy

4: Rapidly growing literature citations

5: Cost-effective

6: In stock supply

7: Development of many new targets to meet the new needs of scientific research

8: Support for personalized antibody customization
